Slot: D

Course Name: Computer Vision Using Open CV

Course Faculty: Dr.M MAYURANATHAN

Project Title: An Intelligent Real-Time Crowd Dynamics Analysis and Monitoring System Using Computer Vision

Module Photographs: (3 photographs –Module Photo, Individual student contribution module work in the project and presentation image)

Project Description: (here you write what you did in this project (contribution) including Model Description)

An Intelligent Real-Time Crowd Dynamics Analysis and Monitoring System Using Computer Vision is designed to monitor and analyze crowd conditions continuously using surveillance video. The system uses Computer Vision and deep learning techniques such as YOLO to detect and track people in real time. It calculates the number of people in a specific area and analyzes crowd density and spatial distribution to identify overcrowded regions. The system also studies the movement, direction, and behavior of people to detect unusual or potentially unsafe crowd conditions. When the crowd density or movement exceeds predefined safety limits, the system generates alerts to notify security personnel or authorities. This helps in taking quick preventive actions and improves the overall safety of people in crowded environments. The system can be effectively used in airports, railway stations, shopping malls, stadiums, educational institutions, and large public events.
